- B. The desired signal reaches the receiving antenna via multiple paths, each of which has a different propagation delay and path loss.
- C. A time-varying change in the path loss of a link with the time variance governed by the movement of objects in the environment, including the transmitter and receiver themselves.
- D. A function of the frequency and should be provided in the cable specification by the vendor.
- E. The minimum signal level for the receiver to be able to acceptably decode the information.

QUESTION: 7

The central office is currently using a combination of 4400 and 2100 series WLAN controllers running v4.2 and a variety of LWAPP-enabled access points servicing both 2.4 GHz and 5 GHz. The WLAN deployment has been extended to each remote office by implementing a 526 WLAN controller running v4.1 and several 521 access points. Wireless client deployment uses EAP-TLS authentication using a centralized RADIUS server plus 802.11n for performance. After the first remote office deployment, remote office users complain that they are not connecting via 802.11n. What is the most likely cause of this problem?

- A. The 526 WLAN controller does not support external authentication via RADIUS, prohibiting authentication.
- B. The 521 AP does not support 5 GHz, which prohibits 802.11n.
- C. The 521 AP and 526 WLAN controllers do not support AES, which prohibits 802.11n.
- D. The 526 WLAN controller does not support 802.11n with v4.1 and must be upgraded to v4.2.
- E. The 526 WLAN controller does not support 802.11n with either v4.1 or v4.2.
