You use the Microsoft .NET Framework version 3.5 to create a Microsoft ASP.NET Web application. The application must redirect the original URL to a different ASPX page. You must make sure that after the page is executed, the users cannot view the original URL. Besides this, you must make sure that only one request from the client browser is required by each page execution requires. So what action should you perform to achieve the two goals?

- A. You should transfer execution to the correct ASPX page by using the `HttpContext.Current.RewritePath` method.
- B. Add the Location: new URL value to the `Response.Headers` collection. Call the `Response.End()` statement. Send the header to the client computer to transfer execution to the correct ASPX page.

Answer: A**Question: 2**

You are an application developer and you have about two years experience in developing Web-based applications by using Microsoft ASP.NET. Now you are employed in a company named Wikigo. You use the Microsoft .NET Framework version 3.5 to create a Microsoft ASP.NET Web application. A Web page is created. The Web page contains the following two XML fragments. (Line numbers are used for reference only.)

```
1 <script runat="server">
2
3 </script>
4 <asp:ListView ID="ListView1" runat="server"
5 DataSourceID="SqlDataSource1"

9 <td>
10 <asp:Label ID="WireAmountLabel" runat="server"
11 Text='<%# Eval("WireAmount") %>' />
12 </td>
13 </ItemTemplate>
```

From a Microsoft SQL Server 2005 database table which has a column named `WireAmount`, the `SqlDataSource1` object retrieves the data. Now you receive an order from your company CIO, according to his requirement, the column must be displayed in red color when the size of the `WireAmount` column value is greater than seven characters. The CIO assigns this task to you that you must make sure of this. So what action should you perform?

- A. Insert the following code segment at line 06. `OnDataBound="FmtClr"` Insert the following code segment at line 02. `protected void FmtClr(object sender, EventArgs e){ Label WireAmount = new Label(); WireAmount.ID = "WireAmountLabel"; if (WireAmount.Text.Length > 7) {WireAmount.ForeColor = Color.Red; } else {WireAmount.ForeColor = Color.Black; }}`
- B. Insert the following code segment at line 06. `OnItemDataBound="FmtClr"` Insert the following code segment at line 02. `protected void FmtClr(object sender, ListViewItemEventArgs e){`

- ```
